412 Chapter 12 Alcohols, Phenols, Ethers, and Halides

**Table 12.3** Molecular Weights, Boiling Points, and Solubilities of Some Simple Alkanes, Alcohols, and Ethers

| Name                | Structural Formula                                                                  | MW | BP (°C) | Solubility in Water |
|---------------------|-------------------------------------------------------------------------------------|----|---------|---------------------|
| Ethane              | CH <sub>3</sub> —CH <sub>3</sub>                                                    | 30 | -88     | Insoluble           |
| Methanol            | CH <sub>3</sub> —OH                                                                 | 32 | 65      | Soluble             |
| Propane             | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>3</sub>                                   | 44 | -42     | Insoluble           |
| Dimethyl ether      | CH <sub>3</sub> —O—CH <sub>3</sub>                                                  | 46 | -23     | Soluble             |
| Ethanol             | CH <sub>3</sub> —CH <sub>2</sub> —OH                                                | 46 | 78      | Soluble             |
| Butane              | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>2</sub> —CH <sub>3</sub>                  | 58 | 0       | Insoluble           |
| Ethyl methyl ether  | CH <sub>3</sub> —CH <sub>2</sub> —O—CH <sub>3</sub>                                 | 60 | 11      | Soluble             |
| 1-Propanol          | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>2</sub> —OH                               | 60 | 97      | Soluble             |
| Ethylene glycol     | HO—CH <sub>2</sub> —CH <sub>2</sub> —OH                                             | 62 | 198     | Soluble             |
| Pentane             | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>2</sub> —CH <sub>2</sub> —CH <sub>3</sub> | 72 | 36      | Insoluble           |
| Diethyl ether       | CH <sub>3</sub> —CH <sub>2</sub> —O—CH <sub>2</sub> —CH <sub>3</sub>                | 74 | 35      | Slightly soluble    |
| Methyl propyl ether | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>2</sub> —O—CH <sub>3</sub>                | 74 | 39      | Slightly soluble    |
| 1-Butanol           | CH <sub>3</sub> —CH <sub>2</sub> —CH <sub>2</sub> —CH <sub>2</sub> —OH              | 74 | 117     | Slightly soluble    |
| 1,3-Propanediol     | HO—CH <sub>2</sub> —CH <sub>2</sub> —CH <sub>2</sub> —OH                            | 76 | 214     | Soluble             |

reason is hydroxyl atom, so both

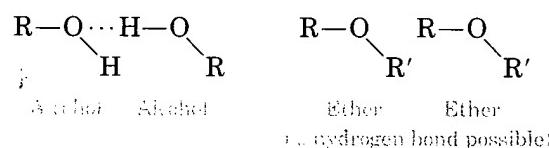

Alcohols and phenols are soluble in water because they contain a hydroxyl group. For example, ethanol (CH<sub>3</sub>—CH<sub>2</sub>—OH) has a molecular weight of 46. It forms hydrogen bonds with water molecules, so it is soluble in water. In contrast, heptane (CH<sub>3</sub>—CH<sub>2</sub>—CH<sub>2</sub>—CH<sub>2</sub>—CH<sub>2</sub>—CH<sub>2</sub>—CH<sub>3</sub>) has a molecular weight of 100 and is insoluble in water.

As you might expect, alcohols are more soluble than ethers because they have a hydroxyl group.

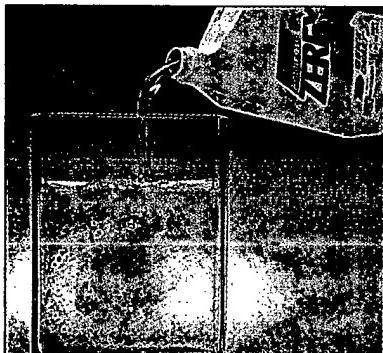

### Boiling Point

Ethers have about the same boiling points as alkanes of similar molecular weight. Thus, with respect to boiling points, ethers are essentially no different from hydrocarbons or halides.

This is not true for alcohols. The boiling points of alcohols are much higher than those of the corresponding alkane and ether, and those of the diols are much higher still. This is easily explained by hydrogen bonding. Each alcohol molecule can form a hydrogen bond with another one, but an ether molecule cannot:

Review Section 6.6 for a discussion of which molecules can form hydrogen bonds.

Hydrogen bonding accounts for ethylene glycol's viscosity and its solubility in water. (Photograph by Charles D. Winters.)

### 12.8 Thiols, Sulfides, and Sulfur Compounds

Thiols and thioethers are sulfur analogs of alcohols and ethers.

but are much more reactive than their oxygen analogs. This is worth mentioning.

1. Thiols have the ability to form hydrogen bonds to have higher boiling points than their oxygen analogs. This is bad that chemists often use thiols as solvents because they are liquid at room temperature and can be easily squirted onto surfaces.

2. Thiols are strong reducing agents.

3. Thiols are strong oxidizing agents.

### Solubility in Water

A look at Table 12.3 shows that both alcohols and ethers are soluble in water, up to about three or four carbons. This behavior is, of course, completely different from that of the hydrocarbons and halides. Again, the
